## Subject: Subframe Design Improvement for Drop Frames

Stoughton Trailers has implemented an improvement to the design of the drop frame trailers. The suspension subframe channels have been extended to provide greater support to the floor at the rear of the trailer. The new 2-piece design provides additional strength in this critical area from the wear and tear of loading and unloading the trailer. The two pieces are connected with Huck fasteners to each other and to the slider rails. The channels now extend all the way to the rear frame, rather than spanning just the length of the fixed suspension.

Pictured below is the new design. This change is effective immediately.
