Subject: Knee Irons on Rear Frame

Stoughton Trailers has added knee irons to the upper corners of the rear frames used on all swing door, dry van trailers. Knee irons help provide additional strength to the rear frame, particularly during the welding and galvanizing process. The added strength helps ensure that the frame is manufactured straight and true. This running change has been implemented on all new Stoughton swing door trailers over the course of the last 30 days.

Please contact your sales representative if you have any questions.
